AI for Everyday Work: Writing Copy & Content

From One Marketing Idea to 10 Customer Conversations

Rahul Tripathi · Head of Digital Marketing, Airtel Business

What We Have Built So Far

1

WHO

Identified target audience

2

WHY US

Crafted our positioning

3

WHERE

Chose the right channels

4

WHEN

Mapped communication timing

Today: What exactly do we write — and how do we write 20 things without feeling like we wrote 20 things?

Meet Our Marketer: Priya

The Brief

"We are launching a new cloud-security solution."

Deadline? Yesterday.

Old workflow: 8 formats = 8 writing exercises
AI workflow: 1 strong strategic input → multiple contextual drafts

Priya Needs:

- LinkedIn post
- LinkedIn InMail
- Search ad
- Email
- WhatsApp message
- Sales call script
- Nurture sequence
- Landing-page copy

⚠ Copy-paste the same message everywhere and you haven't done multichannel marketing. You've done **Ctrl+C marketing.**

One Message ≠ One Format

Core proposition: **"Reduce security risk for employees working from anywhere."** The strategic idea stays constant — but the expression must change by channel.

LinkedIn

Someone is **scrolling**

Google

Someone is **searching**

Email

Someone is **opening their inbox**

WhatsApp

Someone gave you access to a **very personal space**

Sales Call

Someone is deciding whether to **hang up**

Same proposition. Different behaviour. Different copy.

B2C and B2B: Same Channels, Different Jobs

A common mistake: *"Email is B2B"* or *"Instagram is B2C."* Ask instead: **What role does the channel play?**

B2C

- Large audiences
- Often shorter purchase journey
- Individual decision
- Emotion can dominate
- High transaction volume
- Personal usage

B2B

- Narrower buying groups
- Often longer journey
- Multiple stakeholders
- Business justification matters
- Higher value per conversion
- Organisational impact

The same channel can play very different roles.

Email: Why It Still Matters

Email gives you something advertising often doesn't: **continued permission to communicate.**

B2C Use Cases

- Offers & abandoned carts
- Product discovery
- Replenishment & loyalty
- Re-engagement

B2B Use Cases

- Lead nurturing
- Content distribution
- Event follow-up
- Case studies & sales enablement

⚠ Email isn't: *"Send the same newsletter every Tuesday because the calendar says so."*

WhatsApp: Attention Is High, Tolerance Is Low

B2C

- Order updates & offers
- Reminders & replenishment
- Support

B2B

- Qualified lead follow-up
- Event reminders
- Seller-assisted journeys

Copy Implication

WhatsApp copy should be: **Shorter + contextual + actionable.**

> Nobody has ever been delighted after reading: "Dear Valued Customer, we are delighted to apprise you..."

LinkedIn InMail: Make It Personal — Really

The reader immediately asks: **"Why are you messaging ME?"** Personalisation goes beyond a name.

❌ Weak

"Hi Rahul, we provide industry-leading digital transformation solutions."

Translation: Look at us.

✅ Better

"Hi Rahul, noticed your team is expanding across three locations. We work with IT teams trying to secure distributed users without adding separate security tools."

Translation: We understand your context.

Calls: AI Can Help Before the Call Too

AI isn't only a copywriting tool. It can generate the entire conversation framework.

01

Opening

How do I earn 20 more seconds?

02

Discovery Questions

What should I understand first?

03

Objection Responses

What might they challenge?

04

Proof Points

What evidence actually matters here?

05

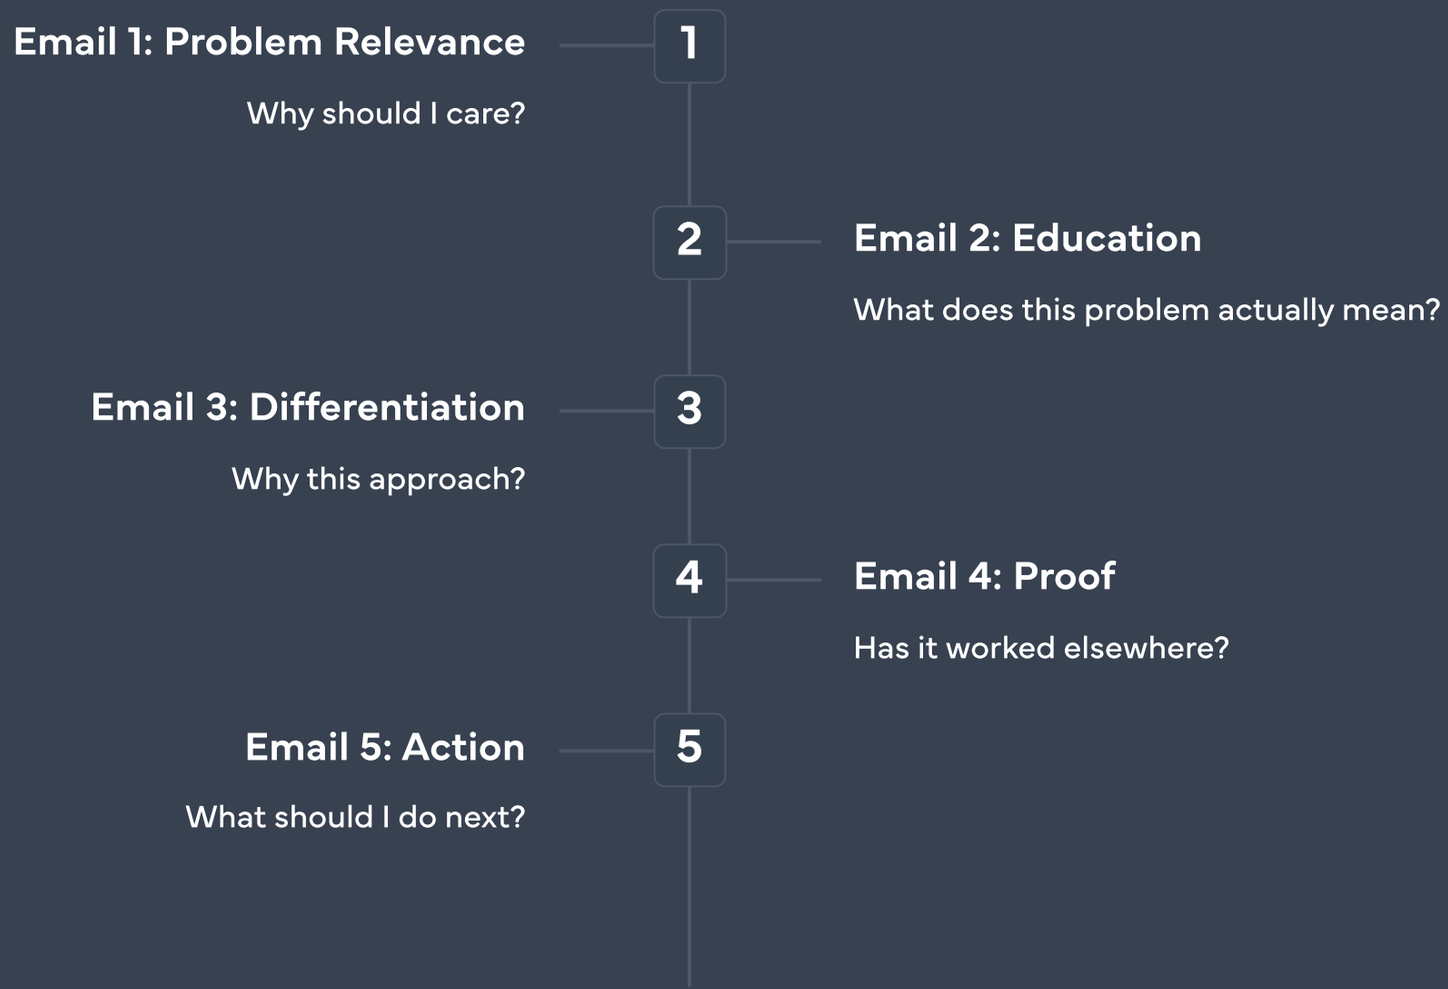

Next Step

What single action am I asking for?

A call script should be a **conversation framework** — not a theatrical script the salesperson reads word for word.

Nurture Emails: Stop Sending Five Product Brochures

A nurture journey should **progressively answer questions** — not repeatedly ask for a demo.

⚠ Five emails all saying "Book a demo" is not nurturing. It is **persistence.**

Ads Have Almost No Patience

Ads operate under severe constraints. They need some combination of attention, relevance, value, and action — often in very little space. Your 600-word AI masterpiece may be excellent. Meta still wants an ad.

Your AI instruction must include:

Platform	**Format**	**Length**
Audience	**Objective**	**Stage**
CTA		

Every Channel Needs a Different Content Structure

Channel	Typical Structure
Email	Subject → Hook → Value → Proof → CTA
WhatsApp	Context → Value → Action
LinkedIn Post	Hook → Insight → Evidence → Takeaway
InMail	Relevance → Problem → Value → Next step
Search Ad	Intent → Benefit → Action
Social Ad	Pattern break → Problem → Promise → CTA
Call	Permission → Discovery → Value → Next step
Nurture	Educate → Build confidence → Progress

Don't only ask AI to change the word count. Ask it to change the **communication architecture.**

Same Product. Seven Expressions.

Core proposition: **Secure employees across locations without increasing IT complexity.**

Search

Secure Hybrid Workforces Without Tool Sprawl

LinkedIn

Your workforce went hybrid. Your security stack probably multiplied with it.

Email

Is hybrid work making security harder to manage?

WhatsApp

Managing security across office + remote teams? Here's a quick checklist for reducing tool sprawl.

InMail

Noticed your organisation has a distributed workforce. Curious how you're handling security across users and locations.

Call

"How are you currently securing employees working outside the corporate network?"

Different wording. Same strategic spine.

Prompt AI With Context, Not Commands

❌ Weak

"Write an email about cybersecurity."

✅ Better Inputs Include:

- **Role:** Who should AI behave like?
- **Audience:** Who is receiving this?
- **Context:** What is happening?
- **Proposition:** What do we offer?
- **Stage:** Where is the customer in the journey?
- **Channel:** Where will they see it?
- **Goal:** What should happen next?
- **Constraints:** What must it avoid?

A Better Prompt

You are a B2B copywriter creating an outbound email
for IT heads at Indian companies with 500+ employees.

They are managing hybrid workforces and may be struggling
with multiple disconnected security tools.

Our proposition is unified workforce security with simpler
policy management.

The reader is problem-aware but does not know our brand.

Write an introductory email under 120 words.
Use a professional but conversational tone.
Begin with the customer's situation, not our company.
Include one low-friction CTA.
Avoid: "cutting-edge", "transform", "best-in-class".

Notice: We didn't teach AI English. **We gave it marketing context.**

The Multi-Format Master Prompt

Once the strategy is clear, a single prompt can generate an entire channel set:

> Using the customer and positioning information below, create: one email, one WhatsApp message, one LinkedIn post, one LinkedIn InMail, one search ad concept, one social ad, and one 30-second call opening. Keep the core proposition consistent but adapt structure, length, tone and CTA to how customers behave on each channel. After each draft, explain in one sentence what you changed because of the channel.

That last instruction is powerful. It forces AI to **demonstrate the adaptation logic** — not just produce output.

Add Channel Guardrails

AI gets considerably better when you tell it what **not** to do.

WhatsApp

Maximum 50 words. One CTA. No formal salutation.

LinkedIn

Lead with insight, not product. Avoid immediate sales pitch.

Email

One primary argument. One CTA. Avoid lengthy company introduction.

Calling

Do not write a monologue. Include two discovery questions.

Ads

One communication idea per variant.

Constraints create focus.

Don't Search for the Perfect First Prompt.

A common AI myth: *"If my prompt is perfect, the first output will be perfect."*

You don't brief human writers that way. You:

1	2
Brief	**Review**
3	4
Feedback	**Improve**

Iterative prompting beats prompt perfection. Do the same with AI.

Iteration 1: Get the Raw Material

The Prompt

> Generate five LinkedIn hooks around the security complexity created by hybrid work.

AI gives options. But don't immediately ask: *"Make them better."* That's vague feedback.

Diagnose First. Ask:

- Too generic?
- Too dramatic?
- Too technical?
- Too product-heavy?
- Wrong audience?
- Weak insight?

Then refine.

Iteration 2: Give Direction

❌ Vague

"Make it punchier."

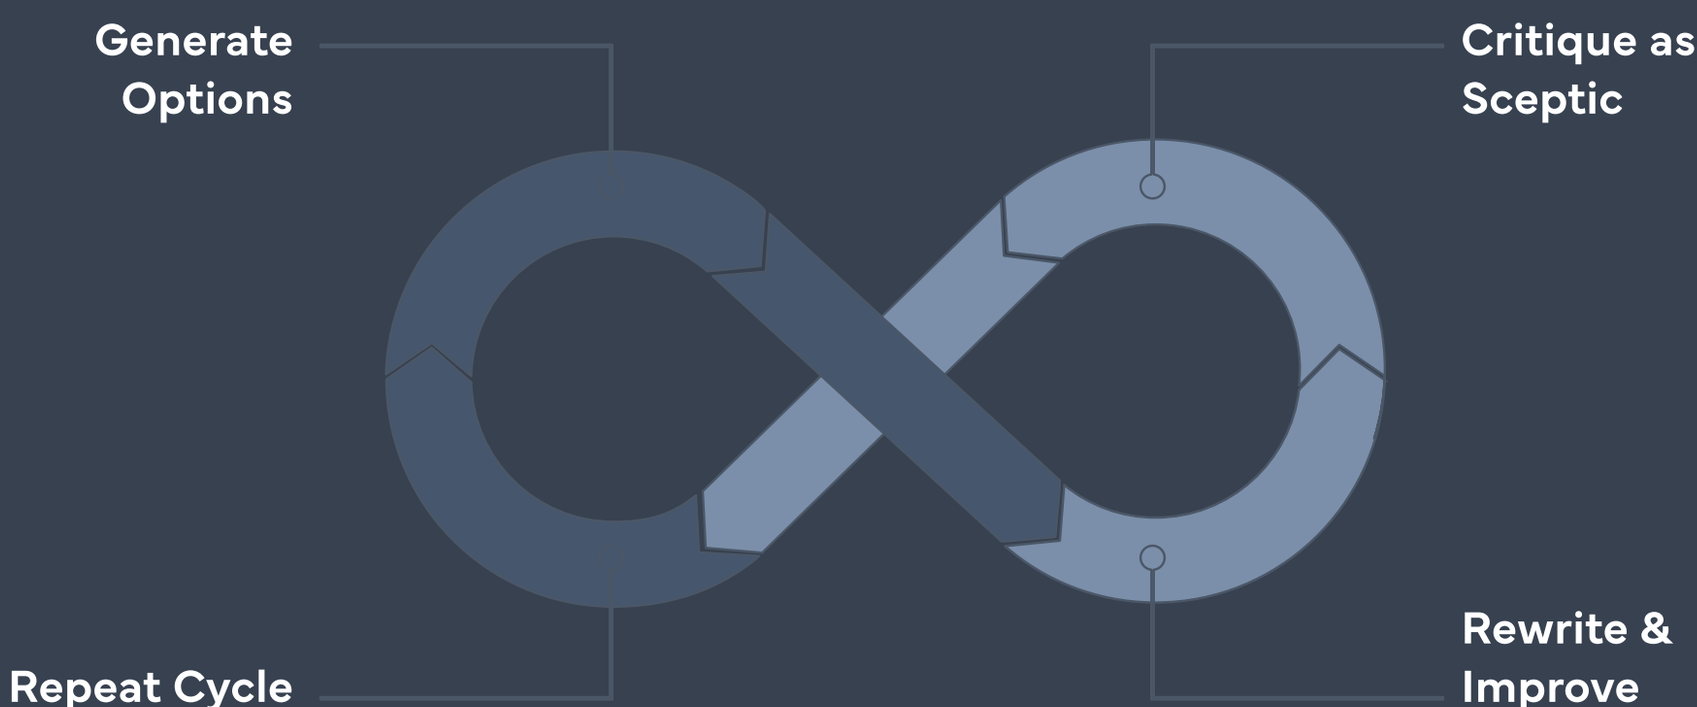

✅ Specific Direction

"Options 2 and 4 are closest. Rewrite them for an IT leader rather than a general business audience. Remove fear-based language. Make the tension about operational complexity rather than cyberattack risk. Keep each under 14 words."

Now AI knows: **what worked, what failed, and where to move.**

Iteration 3: Ask AI to Attack It

> Act as a sceptical IT head receiving these messages. For each option tell me: what sounds generic, what I would distrust, what feels irrelevant, what would make me continue reading.

This is a powerful pattern: AI does not only need to be the writer. **Make it the editor too.**

But You Still Choose

Suppose AI produces 15 options. It can score them, compare them, and rewrite them.

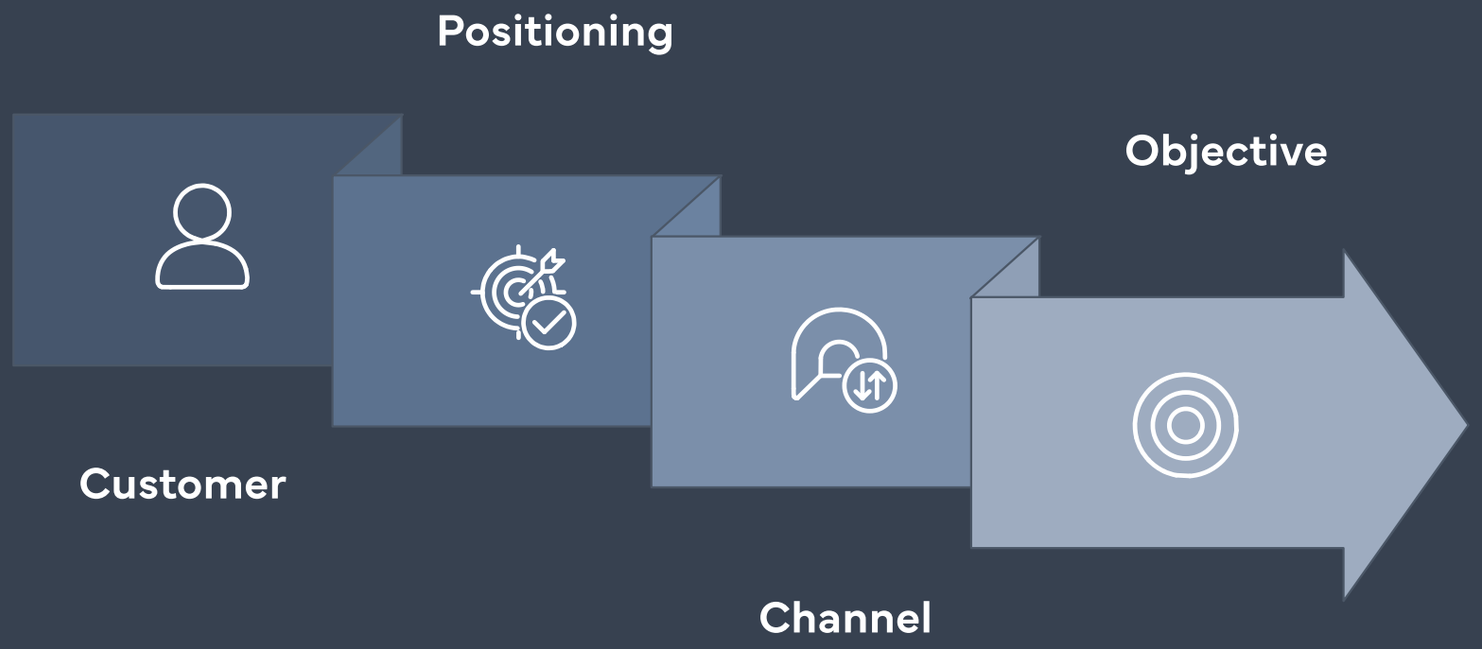

But the marketer still decides:

- [ ] **Which insight matters?**
- [ ] **What is believable?**
- [ ] **What matches the brand and fits market context?**
- [ ] **What deserves testing?**

Volume of output ≠ quality of judgment.

The Everyday AI Content Workflow

⚠ The biggest mistake is skipping from **Generate** straight to **Publish.**

QUIZ · QUESTION 1

Adapting LinkedIn to WhatsApp

A team converts a LinkedIn post into a WhatsApp message by simply reducing its word count. What is the most important weakness?

1	2
A The copy may preserve a structure that does not suit WhatsApp behaviour	**B** The copy may lose keywords required for social-media distribution

3	4
C The message may become too short to communicate any meaningful proposition	**D** The message may require an additional headline before delivery

Correct Answer: A — Reducing word count doesn't change the communication architecture. WhatsApp requires a fundamentally different structure.

QUIZ · QUESTION 2

First Email to a Problem-Aware Prospect

A B2B marketer is creating the first email for a problem-aware prospect who does not know the brand. Which structure is strongest?

1	2
A Company credentials → product catalogue → pricing → meeting request	**B** Customer context → relevant problem → value → low-friction next step
3	**4**
C Product features → competitor weakness → discount → purchase request	**D** Brand history → market statistics → product portfolio → contact details

Correct Answer: B — Start with the customer's world. Lead with their problem before your solution.

QUIZ · QUESTION 3

InMail That Personalises Superficially

An AI-generated InMail is personalised with the recipient's name and company but still performs poorly. What should be examined next?

1	2
A Whether the message demonstrates relevance beyond superficial identity variables	**B** Whether the recipient's name appears more frequently throughout the communication
3	**4**
C Whether the company description contains sufficient technical detail	**D** Whether the message uses the same structure as the highest-performing email campaign

Correct Answer: A — A name and company logo is not personalisation. Relevance comes from context: role, situation, challenge.

QUIZ · QUESTION 4

Why Iterative Prompting Wins

Why is an iterative prompt usually stronger than repeatedly asking AI to "make it better"?

1

A

It narrows the model toward specific weaknesses and desired communication choices

2

B

It increases the probability that AI will generate substantially longer copy

3

C

It prevents the model from changing words that appeared in the initial response

4

D

It guarantees the final draft will outperform copy written without generative AI

Correct Answer: A — Specific diagnostic feedback outperforms vague improvement requests every time.

QUIZ · QUESTION 5

Multichannel Consistency: What Should Stay the Same?

A marketer creates email, WhatsApp and call scripts from one positioning statement. What should remain most consistent?

1	2
A The sentence structure and CTA wording used across each channel	**B** The central customer value while execution adapts to channel behaviour
3	**4**
C The total amount of product information communicated within every channel	**D** The communication length so customers receive equivalent detail everywhere

Correct Answer: B — Strategy is constant. Execution is channel-specific.

Rapid Revision: One Idea, Many Expressions

Same strategy does not mean **same copy.** Your core proposition remains stable.

Structure	Length
Opening	Proof
CTA	Tone

Change each one based on: **Channel + Customer Behaviour + Buying Stage**

The Prompt Cheat Sheet

Before asking AI to write, give it every layer of context:

WHO

Audience

WHY

Customer problem

WHAT

Proposition

WHERE

Channel

WHEN

Journey stage

DO

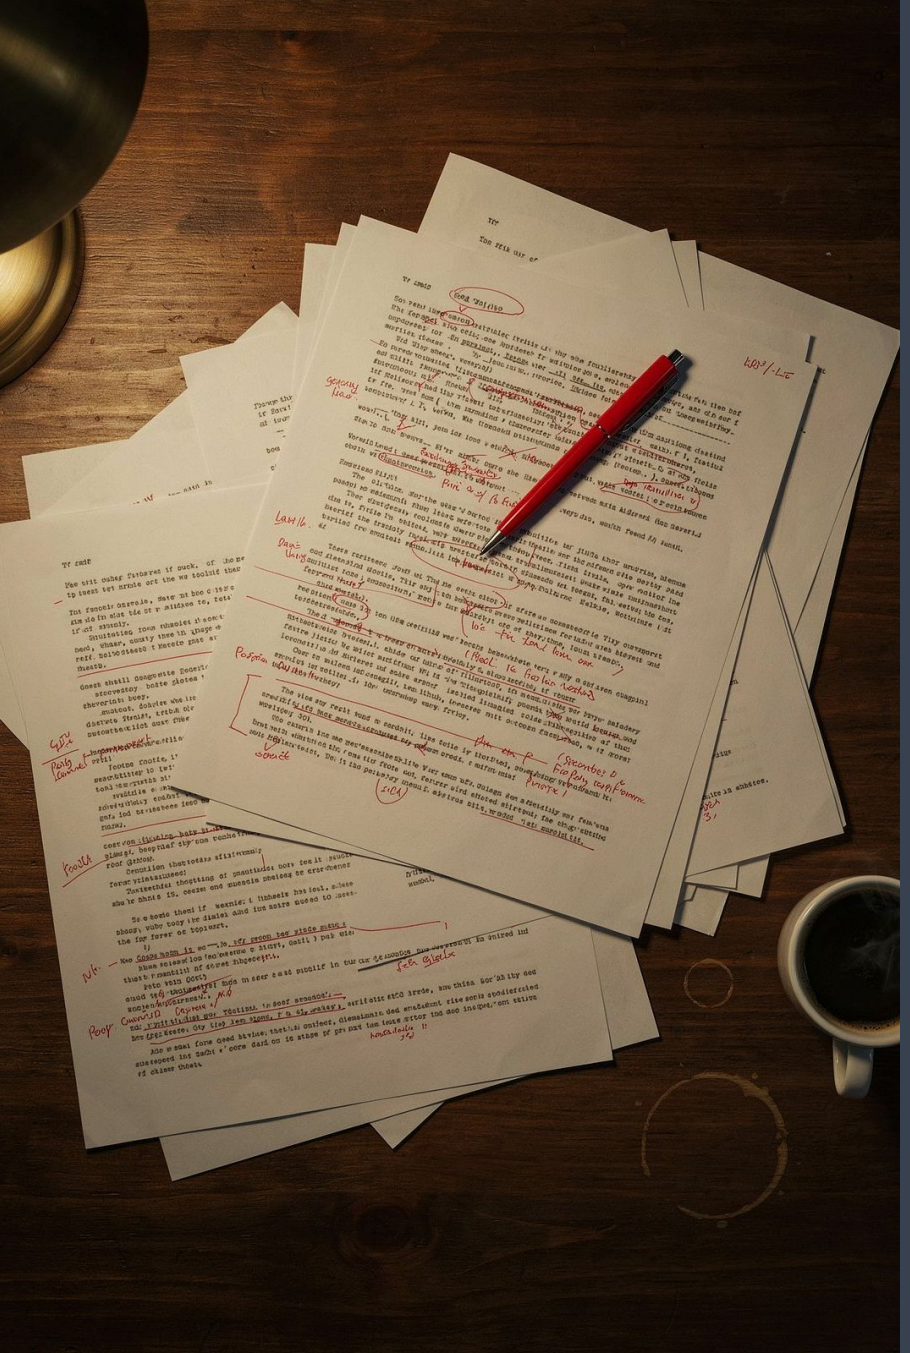

Desired action

DON'T

Constraints

Generate **Critique** **Refine**

From Generating to Editing

AI can give you a draft extremely quickly.

Your advantage comes from knowing: **What deserves to stay?**

AI Wrote It. Now Comes the Difficult Part.

> In today's rapidly evolving digital landscape, businesses must embrace innovative, cutting-edge solutions to unlock unprecedented growth and stay ahead of the curve.

Looks professional. Also says almost nothing.

Now we move from **generating** to **editing.** Because AI can produce a draft at speed. Your competitive advantage comes from editorial judgment — knowing what deserves to stay, what needs to change, and what should be cut entirely.

Editing Starts With Tone

Tone is: **how the brand sounds while saying something.** The same action produces very different emotional experiences.

Formal

We recommend completing verification before proceeding.

Friendly

Just verify your details and you're ready to go.

Urgent

Verify now to avoid interruption.

Reassuring

It only takes a moment to verify your details.

Same action. Different emotional experience.

Don't Tell AI "Make It Professional"

"Professional" is incredibly vague. Instead, give AI **tone dimensions** it can actually use.

Dimension	Our Brand
Formal ↔️ Conversational	70% conversational
Serious ↔️ Playful	Mostly serious
Technical ↔️ Simple	Simple
Bold ↔️ Cautious	Confident
Expert ↔️ Friendly	Expert-friend
Detailed ↔️ Concise	Concise

Now AI gets something **operational** — not just a feeling word.

Create Actual Writing Guidelines

Instead of: *"Sound like our brand."* Give AI rules it can consistently apply.

- **Use short sentences**
- **Lead with the customer, not the company**
- **Prefer active voice**
- **Explain technical terms**
- **Avoid inflated claims and corporate clichés**
- **One primary idea per paragraph**
- **Prefer specific evidence over adjectives**

These become your **AI writing guardrails** — reusable across every content task.

Define What Your Brand Does NOT Sound Like

Sometimes negative instructions work extremely well.

We ARE:

- Clear
- Knowledgeable
- Direct
- Useful
- Human

We ARE NOT:

- Overexcited
- Preachy
- Cute
- Corporate
- Hyperbolic

❌ *"Revolutionise your digital journey."*

✅ *"Manage all your locations from one platform."*

Reader Persona Changes Writing

Imagine explaining cloud migration to four different people. Same solution. Completely different conversation.

CTO

- Architecture
- Migration risk
- Integration
- Scalability

CFO

- Cost
- Predictability
- Business risk
- ROI

CEO

- Growth
- Resilience
- Transformation impact

Employee

- What changes
- What becomes easier
- What they need to do

Match Complexity to Reader Knowledge

Bad assumption: Complex product = complex writing. Writing complexity should depend on **reader knowledge.**

Executive Version

30 seconds. Big picture outcomes.

Practitioner Version

Operational detail for the people implementing it.

Beginner Version

Simple explanation. No assumed knowledge.

Technical Version

Precise terminology for specialists.

Sales Version

Outcome + proof + next step.

One source. **Multiple cognitive depths.**

Length Is a Strategic Choice

❌ **Don't Say:**

"Make it shorter."

✅ **Say Instead:**

"Reduce this from 180 words to 90 while preserving the problem, differentiator, evidence and CTA. Remove repetition before removing substantive information."

That instruction tells AI **what must survive compression.** Otherwise shortening may remove the very sentence you actually needed.

The Editing Hierarchy

Edit in this order — always. Don't polish a beautifully written claim that is wrong.

1	**6. STYLE**	Does it sound good?
2	**5. LANGUAGE**	Is it clear?
3	**4. STRUCTURE**	Does it flow?
4	**3. AUDIENCE**	Does the reader care?
5	**2. STRATEGY**	Is this the right message?
6	**1. FACT**	Is it true?

Human-in-the-Loop Editing

The marketer's job isn't to correct AI grammar. The marketer adds what AI cannot provide:

Judgment

Is this worth saying?

Context

Will this make sense right now?

Nuance

What is AI missing?

Taste

Does this feel right?

Accountability

Can we defend this claim?

AI provides leverage. **Human remains responsible for the output.**

Learn to Recognise "AI Smell"

These patterns don't prove AI authorship — but together they make writing feel **manufactured rather than authored.**

Structural Tells

- Formulaic introductions
- Excessive symmetry
- Unnecessary headings
- Generic transitions

Language Tells

- Repeated adjectives
- Buzzwords everywhere
- Inflated claims
- Artificial enthusiasm

Trust Tells

- Unsupported facts
- Overused punctuation
- Repeated sentence patterns
- Repetition of the same point

AI Flag: Repetition

> Our seamless platform delivers seamless connectivity through a seamless experience for seamless business operations.

We understand. It is seamless. AI often latches onto keywords because you emphasised them in the prompt.

The Problem

AI doesn't notice when it's using the same word, phrase, or argument four times in one paragraph.

The Fix

Ask AI to identify and remove:

- Repeated nouns and adjectives
- Repeated sentence openings
- Repeated arguments

Remove **conceptual** repetition, not just synonyms.

AI Flag: Buzzwords and Bland Jargon

Transform	Unlock
Elevate	Revolutionary
Best-in-class	Seamless
Robust	Empower
Game-changing	Next-generation

These aren't automatically wrong. The problem is when they **replace meaning.**

Instead of: *"Unlock seamless collaboration."* Ask: **What actually becomes easier?**

AI Flag: Formulaic Structure

AI may repeatedly produce the same narrative skeleton:

⚠ One article? Fine. Twenty articles? Your brand starts sounding like one **very enthusiastic robot.**

AI Flag: Stylistic Tells

Common Patterns to Watch

- Excessive em dashes — everywhere
- "It's not X, it's Y" constructions
- Three-item rhetorical lists, always
- Repeated contrast structures
- Artificially neat conclusions
- Overuse of bold emphasis

The Real Issue

An em dash itself is not "AI writing." The issue is **repetitive patterning.**

Don't replace AI clichés with a new banned-word checklist. The goal is to make the writing **genuinely more natural** — not to pass a detector test.

The Most Dangerous AI Flag: Invented Facts

AI can produce a beautiful, confident sentence containing:

- A fake statistic
- An outdated product capability
- A fictional customer example
- A non-existent study
- A fabricated quotation
- A broken or invented URL

⊗ The prose looks confident. The evidence isn't. **Fluent ≠ Factual.**

A Reusable "Remove the AI Smell" Prompt

Edit the draft below so it reads like an experienced human marketer wrote it. Preserve meaning and all verified factual claims. Remove or rewrite:

- generic introductions and conclusions
- repetitive sentence structures
- repeated keywords or adjectives
- buzzwords and corporate jargon
- inflated or unsupported claims
- artificial enthusiasm and filler transitions

Use natural sentence-length variation. Prefer specific nouns, verbs and examples over adjectives.
Keep tone [INSERT TONE] for [INSERT AUDIENCE].
Do not invent examples, statistics, quotations or product capabilities. Flag anything requiring factual verification instead of guessing.

After editing, list the five most important changes you made and why.

The purpose isn't to "beat an AI detector." The purpose is to create **better writing.**

Watch the Edit Happen

Before

> In today's fast-paced and ever-evolving business landscape, organisations need cutting-edge solutions that seamlessly empower their workforce while unlocking unprecedented productivity.

Ask: What Does It Actually Mean?

Buried underneath the adjectives, the useful thought is:

> Companies need employees to work securely from different locations.

That's the idea worth keeping. Now write *that.*

After Human + AI Editing

> Your employees work from everywhere. Their security should too.

Follow-up: Apply consistent security policies across office and remote users without managing separate tools for every location.

Generic → Specific	**Abstract → Concrete**
Company language → Customer situation	**Adjectives → Meaning**

Run a Structured Edit

Five editing passes are more reliable than *"Please improve this."*

01

Meaning

What is this actually saying?

02

Audience

Why would the reader care?

03

Evidence

Which claims need proof?

04

Language

What can be clearer or shorter?

05

Voice

Does it sound like us?

Fact-Check in Layers

Before publishing AI-generated marketing content, inspect every category systematically.

Category	What to Check
Numbers	Statistics, percentages, prices
Claims	"Fastest", "largest", "leading", "only"
Dates	Launch dates, regulations, market data
People	Names, titles, quotations
Product	Features, availability, specifications
External Evidence	Reports, articles, research
Links	Does the destination actually exist?

Product Facts Deserve Extra Attention

The Risk

"Our platform guarantees 99.999% uptime."

Sounds great. Did your product documentation say that? If not: **delete or verify.**

Source Hierarchy

01

Level 1: Approved product documentation

02

Level 2: Official website

03

Level 3: Approved sales collateral

04

Level 4: Reliable external evidence

Never: *"Claude sounded confident."* Confidence is not evidence.

Add Real Examples After the Draft

AI Produces (Conceptually Correct, Emotionally Empty):

> "Hybrid work creates security challenges."

Human Nuance Makes It Real:

> "Your employee may be in Gurgaon on Monday, Goa on Wednesday, and an airport lounge on Friday. Your security policy still needs to follow the user."

What AI may not have access to: actual customer language, genuine objections, internal anecdotes, real market examples, local cultural context. **Now the idea has a picture.**

Human Nuance Is Often the Competitive Advantage

AI has access to enormous amounts of generalised language. What it may not have:

What your last 20 customers complained about

What your sales team hears every Monday

What your product cannot do

Why your largest customer actually bought

What your competitors all say

AI + generic knowledge = average.
AI + proprietary insight + human judgment = much more interesting.

Prompt or Skill?

A Prompt Is Useful When:

> "I need AI to do this task now."

Fast, flexible, great for one-off tasks and experimentation.

A Skill Is Useful When:

> "I want AI to repeatedly perform this kind of task according to a defined workflow."

Claude Skills are reusable sets of instructions and supporting resources that extend Claude with specialised workflows — applied automatically when relevant.

Think of Claude Skills Like SOPs for AI

Imagine your team repeatedly asks: *"Rewrite this copy in our brand voice."* Instead of pasting 25 rules every time, create a skill containing:

- **Tone Rules**
- **Vocabulary Preferences**
- **Prohibited Phrases**
- **Product Terminology**
- **Editing Checklist**
- **Writing Examples**

Prompt = instruction for the task. **Skill** = reusable operating method.

Example Marketing Skill: Copy Reviewer

The Skill Instructs Claude to:

1. Identify target persona
2. Preserve approved product claims
3. Check brand tone
4. Remove jargon
5. Check CTA quality
6. Flag unsupported statistics
7. Identify unclear acronyms
8. Create a cleaner draft
9. Explain material changes

Supporting Files Could Contain:

- Brand guidelines
- Product naming rules
- Writing examples
- Editorial checklist

Skills can bundle specialised instructions and resources, and organisations can distribute them centrally on supported team setups.

When to Use a Prompt vs. a Skill

Use a Prompt	Use a Skill
One-off task	Repeated workflow
Context changes heavily	Rules remain stable
Experimenting	Standardising
Personal task	Team workflow
Small instruction set	Detailed operating rules
Need flexibility	Need consistency

Example: "Write a Diwali post." → Prompt. "Every asset must go through our 20-point brand compliance review." → Skill.

Prompts vs. Skills: The Trade-Off

Prompts

Advantages

- Fast and flexible
- Easy to modify
- Great for experimentation

Disadvantages

- People forget instructions
- Output varies
- Repeated context required

Skills

Advantages

- Repeatable and consistent
- Shareable across the team
- Encodes organisational knowledge

Disadvantages

- Need setup and maintenance
- Bad instructions scale bad behaviour
- Need updating when rules change

⚠ Standardisation is powerful **only when the standard is good.**

Skills Tell Claude HOW to Work

Connectors tell Claude **where the relevant information lives.**

Claude connectors can access connected apps and services, retrieve information, and — depending on permissions — take actions.

Google Drive

Access approved documents and brand assets

Slack

Pull context from team conversations

Analytics Tools

Retrieve campaign performance data

CRM / Outreach

Connect to customer and prospect data

Skills + Connectors = Interesting Marketing Workflows

Task: *"Create an email promoting Product X."*

Pull Product Info

Find Customer Research

Apply Brand Rules

Generate 3 Email Routes

Run Editorial Checklist

That is much closer to a **marketing operating workflow** than simply "using ChatGPT to write."

A Practical Marketing Example

Your team needs: **A LinkedIn campaign for a cybersecurity product.**

01

Retrieve

Approved product information

02

Retrieve

Previous campaign learnings

03

Apply

Target-audience assumptions

04

Generate

Multiple creative territories

05

Apply

Brand-writing Skill + claim validation

06

Human Review

Add market nuance → Publish / Test

Now AI is not replacing your workflow. **It is sitting inside the workflow.**

QUIZ · QUESTION 1

Scaling Brand Rules Across Recurring Tasks

A company wants every marketer to apply the same 18 brand-writing rules across hundreds of recurring content tasks. Which approach is most appropriate?

1

A

Store the reusable workflow in a Skill and provide task-specific context separately

2

B

Rewrite the full instructions manually whenever an individual content request begins

3

C

Connect external applications so Claude can infer the desired writing style

4

D

Reduce guidelines to one tone adjective so marketers retain maximum flexibility

Correct Answer: A — Skills encode repeatable, consistent workflows. Task context can vary; the rules shouldn't.

QUIZ · QUESTION 2

Handling Unverified Claims

An AI draft has excellent tone and structure but contains an unverified claim that the product is "India's fastest platform." What should happen first?

1	2
A Retain the claim temporarily and improve its wording before external verification	**B** Replace "fastest" with "leading" because softer adjectives require less supporting evidence
3	**4**
C Verify the claim against an authoritative source or remove it from the communication	**D** Ask a second AI model whether the statement appears commercially plausible

Correct Answer: C — Verify or delete. "Softer" superlatives still require evidence.

QUIZ · QUESTION 3

Shortening Without Losing the Point

A marketer asks AI to shorten a 200-word executive email to 80 words. The result loses the most important evidence. What was missing?

1

A

An instruction defining which communication elements must survive the compression

2

B

An instruction requiring greater vocabulary variation across the shortened message

3

C

An instruction forcing every original sentence to retain a corresponding shortened sentence

4

D

An instruction preventing the model from changing paragraph order during rewrite

Correct Answer: A — Always tell AI what must survive before you ask it to compress.

QUIZ · QUESTION 4

Skill vs. Connector

What is the strongest distinction between a Claude Skill and a connector?

1	2
A A Skill encodes repeatable ways of working, while a connector provides access to tools or data	**B** A Skill retrieves external company information, while a connector determines editorial tone
3	**4**
C A Skill is intended for B2B workflows, while connectors primarily support consumer marketing	**D** A Skill creates final marketing assets, while connectors are limited to reading static documents

Correct Answer: A — Skills = HOW to work. Connectors = WHERE the information lives.

QUIZ · QUESTION 5

Fixing Copy That Feels AI-Written

A draft feels recognisably "AI-written" despite having no factual errors. Which editing approach is strongest?

1

A

Remove visible stylistic patterns while preserving generic claims and overall sentence structure

2

B

Add unusual vocabulary so the writing differs from common AI vocabulary

3

C

Re-anchor the copy in specific audience context, natural phrasing and concrete evidence

4

D

Replace all punctuation associated with AI writing before evaluating the underlying argument

Correct Answer: C — Specificity, context, and real evidence are what make writing feel human.

Rapid Revision: The Editing Order

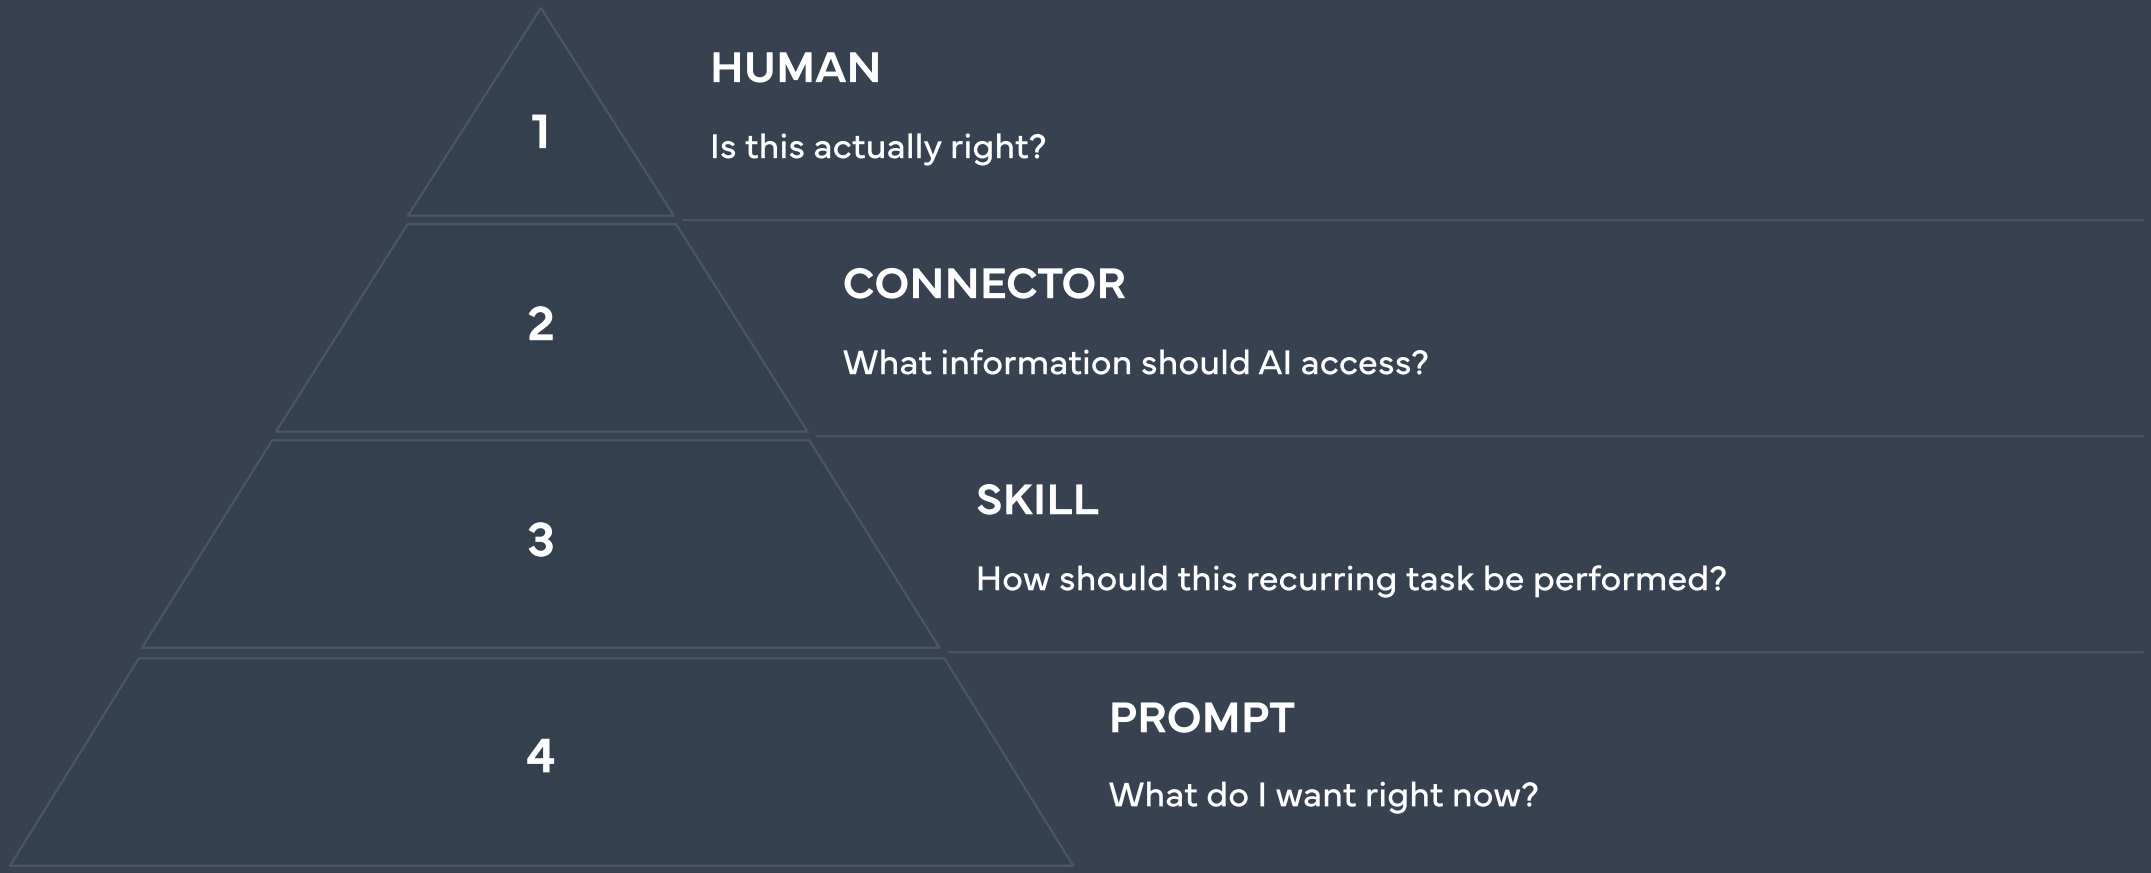

Don't begin with: *"Does this sound nice?"*

1	**6. ON-BRAND?**	Tone
2	**5. CLEAR?**	Language
3	**4. LOGICAL?**	Structure
4	**3. RELEVANT?**	Audience
5	**2. RIGHT?**	Strategy
6	**1. TRUE?**	Fact

Only then is the copy ready.

The AI Work Stack

Think in four layers — each one adding a different kind of intelligence to your work.

The bottom layers power the machine. **The top layer is the important one.**

Key Takeaways

- [ ] **Strategy is constant. Execution is channel-specific.**

  One proposition. Many expressions. Never Ctrl+C marketing.

- [ ] **Context beats commands.**

  Give AI role, audience, channel, stage, goal, and constraints — not just a topic.

- [ ] **Generate → Critique → Refine → Human Review.**

  Never skip from generate to publish. Iteration beats perfection.

- [ ] **Fluent is not factual.**

  Verify every claim. Your source hierarchy matters more than AI confidence.

- [ ] **Build skills, not just prompts.**

  Repeatable workflows + proprietary context + human judgment = competitive advantage.
